

Airsoft Sniper Rifle

When looking to purchase an airsoft sniper rifle, you should take a couple of things into consideration, such as: what is the effective range of the airsoft sniper rifle? What velocity does the sniper rifle shoot at? Does it have an adjustable stock length? How heavy is the gun, and so on, so forth. Also, there are some other less important details, such as the color and style of the airsoft sniper rifle. Anyone looking to purchase airsoft sniper rifles should do a little research before deciding on which type (and even which brand) of airsoft rifle to buy.

The most popular type of airsoft sniper rifle seems to be the type 96 model, which has a grip similar to a pistol. Also, it would seem that for the most part most people want to go with a black or a camo colored sniper rifle airsoft gun; perhaps this is because a black or camo colored rifle is perceived as being harder to see by other airsoft players? Lastly, there are some other fairly popular airsoft sniper rifle color variations, most notably the OD Green, the desert camo, and the realistic looking wood color design.

Many of the high end airsoft sniper rifle guns come with a scope, bi-pod, and usually a sling as well. And if you want to upgrade the scope that comes with it, that is usually pretty easy, as most of the good airsoft sniper rifle guns have a real scope mount, much like a real sniper rifle does. This gives you a lot of flexibility when it comes to upgrading the scope. Some of the more expensive scopes that can be used have illuminated reticles, which usually run off of AA batteries.

As far as velocity, most of the better airsoft sniper rifle guns fall right about within the 450 to 480 FPS range (using 0.20g airsoft BBs), and are bolt action airsoft spring sniper rifle guns. Spring powered airsoft sniper rifles are always single shot, and need to be cocked every time before being fired. This is what makes the airsoft sniper rifle so similar to the REAL sniper rifles used by military & law enforcement agents!

The gas airsoft sniper rifle is also fairly popular, but unlike the spring airsoft sniper rifle, it is less realistic than traditional sniper rifles, due to the fact that it is semi-auto. Also, they need to use "green gas" to fire, which means that, unlike the spring powered airsoft sniper rifle, the amount of times that they can be fired is limited by how much gas is remaining. This is probably the main reason why most people prefer the bolt action (spring) airsoft sniper rifle. Another factor is that you can get a spring airsoft sniper rifle cheap - unlike the more expensive gas airsoft sniper rifle.

The 2 most popular manufacturers of airsoft sniper rifle guns are UTG and Cybergun. It is safe to say that our most popular airsoft sniper rifle is the UTG Shadow Ops Type 96 airsoft sniper rifle, followed by the Cybergun Mauser Pro Tactical Type 96 airsoft sniper rifle. The UTG Army Digital Shadow Ops (Camo) airsoft sniper rifle is also quite popular as well. Some of the other, less popular airsoft spring sniper rifle gun manufacturers are UHC, TSD, and Crosman. Also, surprisingly enough, the popular manufacturer, Echo 1, does not seem to even manufacture true airsoft sniper rifles for some reason. However, they do make a lot of high end airsoft m4, airsoft ak-47, and airsoft m16 rifles, which can be used as semi auto sniper rifles.
